

Ontology

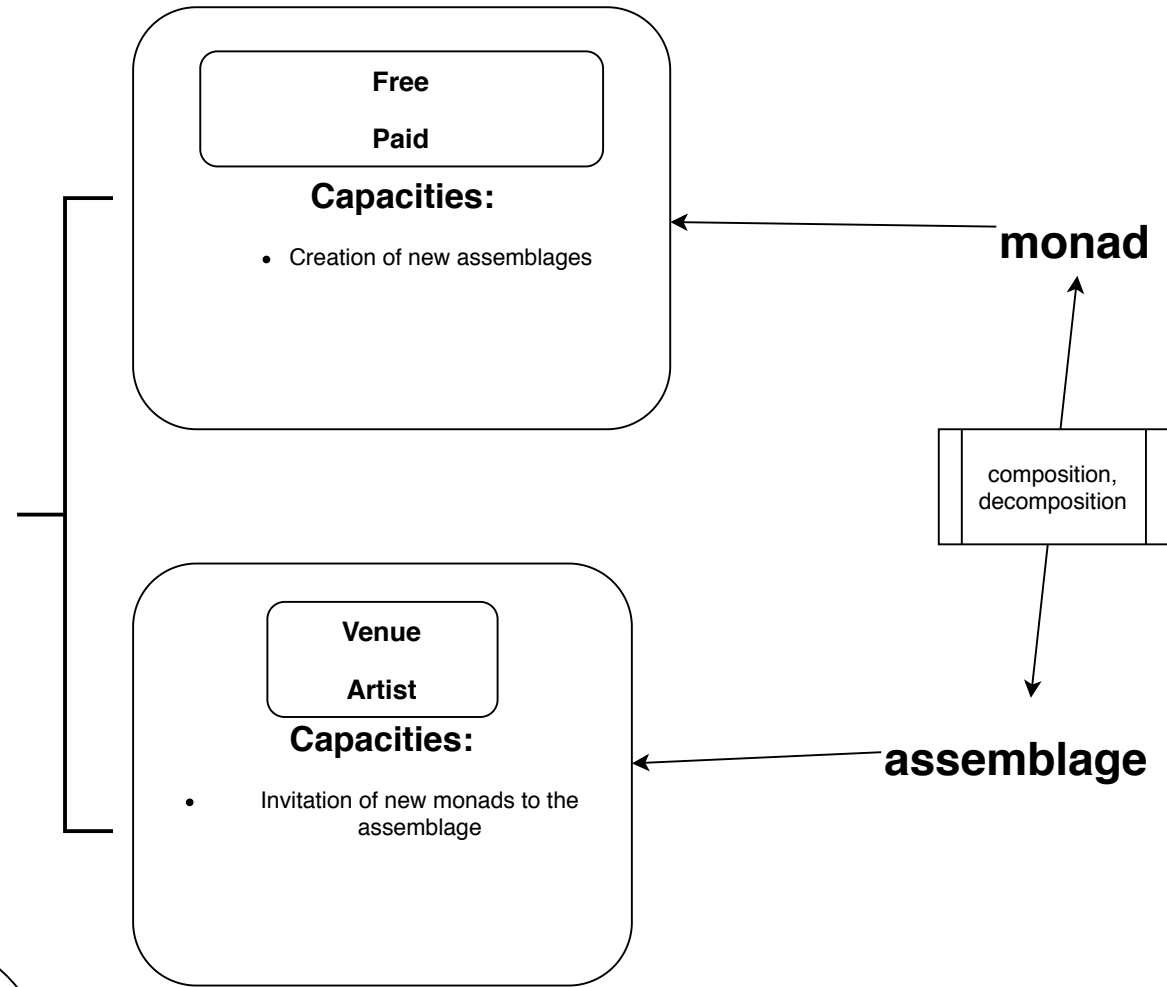

There are two diachronous genera in this world, representing three species. Monads represent individual users, whilst assemblages represent different higher-order collectives that monads can take part in. Regardless of genera, each species affords common capacities and properties:

Intergeneric Capacities:

- The ability to communicate with any other species, regardless of genera, via real-time messaging.
- The ability to view a stream of events

Intergeneric Properties:

- Unique identifier that facilitates communication between species

Question::: Is it primarily a user-based flow where the user has specific privileges on different pages based on assemblage membership, OR is it primarily a two-stage flow wherein the user has to switch to an assemblage profile in order to exercise the privileges of that assemblage?
